1. Postgraduate education and risk management Abstract:

The actual circumstances of clinical training show great changes such as the shift of the postgraduates from university hospitals to general training hospitals. As the actual state of the clinical practice, in a system in which a same postgraduate is not engaged in the medical care all the time, but portgraduates shift through the wards of various departments in rotation, risk management is an extremely difficult problem. Though various countermeasures such as the restriction of the medical practice by postgraduates and preparation of the training guideline are taken, still, it can be called a groping condition. In the safety management, though chemical administration, for example, is a universal theme, troubles in which postgraduates are concerned are a large problem. Along with the general examination of the system, the development of a system for off-the-job training of postgraduates is also desired.
